What Is User-Managed Access And Why Do We Need It?

Presented by several UMAntarians (participants in the Kantara UMA Work Group) with WG chair Eve Maler as your emcee

(Questions? Contact eve@xmlgrrl.com / @xmlgrrl or maciej.machulak@cloudidentity.co.uk / @mmachulak anytime)
What Is User-Managed Access And Why Do We Need It?

Presented by several UMAnitarians (participants in the Kantara UMA Work Group) with WG chair Eve Maler as your emcee

(Questions? Contact eve@xmlgrrl.com / @xmlgrrl or maciej.machulak@cloudidentity.co.uk / @mmachulak anytime)
Agenda

Introduction: What is UMA, why do we need it, and how far along is it?

Use cases illustrating UMA’s unique strengths

Why would an organization want to UMA-enable its apps?

Existing UMA implementations

How UMA works to build technical and business trust

Q&A
Privacy is not about secrecy

- Ann Cavoukian, Information and Privacy Commissioner of Ontario, Privacy in the Clouds paper

The goal of a flexible, user-centric identity management infrastructure must be to allow the user to quickly determine what information will be revealed to which parties and for what purposes, how trustworthy those parties are and how they will handle the information, and what the consequences of sharing their information will be.

It’s about context, control, choice, and respect
The price for sharing access to our data is too high
The price for sharing access to our data is too high.

Either we have to do all the work ourselves.

...often in the role of the “product,” not the “customer”
The price for sharing access to our data is too high

Either we have to do all the work ourselves

Or we have to agree to install large data pipelines

...often in the role of the “product,” not the “customer”

...resulting in oversharing of high-quality data and a “too many subscriptions” problem
The price for sharing access to our data is too high

Either we have to do all the work ourselves

Or we have to agree to install large data pipelines

Or we share with friends through “secret links”

...often in the role of the “product,” not the “customer”

...resulting in oversharing of high-quality data and a “too many subscriptions” problem

...rebuilding friend lists over and over – and hoping they won’t give away the store
UMA is...

(see also the FAQ)

• A web protocol that lets you control access to all your online stuff from one place

• A set of draft specifications, free for anyone to implement

• Undergoing multiple implementation efforts

• A Work Group of the Kantara Initiative, free for anyone to join and contribute to

• Striving to be simple, OAuth-based, identifier-agnostic, RESTful, modular, generative, and developed rapidly

• Contributed to the IETF for consideration: draft-hardjono-oauth-umacore-02

• Heading towards interoperability testing and increased OpenID Connect integration in early 2012
UMA enables you to manage sharing and protect access from a single hub

UMA gives users a digital footprint dashboard

Source: http://www.flickr.com/photos/paraflyer/2749336420/
UMA gives users a digital footprint dashboard

Web 2.0 access control today is inconsistent and unsophisticated

You can unify access control under one AM

Source: http://www.flickr.com/photos/paraflyer/2749336420/
Web 2.0 access control today is inconsistent and unsophisticated

You have to name known people in order to share with others

You can unify access control under one AM

Your AM can test for claims like “over 18”
UMA gives users a digital footprint dashboard

Web 2.0 access control today is inconsistent and unsophisticated

- You have to name known people in order to share with others
- You must be online in order to authorize access

- You can unify access control under one AM
- Your AM can test for claims like “over 18”
- You can set up policies that work while you’re away

Source: http://www.flickr.com/photos/paraflyer/2749336420/

Similar to "friends and family" sharing but more secure

Vendor Relationship Management sharing

Requesting user (person-to-self sharing)

Bob

Requesting user (person-to-person sharing)

Carl

Requesting party (person-to-organization sharing)

tinyurl.com/umawg
Alice becomes an empowered peer in an authorized data sharing network.

Alice's protected online stuff

Similar to OAuth-mediated or OpenID Connect-based access

Similar to "friends and family" sharing but more secure

Vendor Relationship Management sharing

Requesting user (person-to-self sharing)

Requesting user (person-to-person sharing)

Requesting party (person-to-organization sharing)

Requesting party (person-to-organization sharing)
Use case: Sharing trusted identity attributes with anyone

- The NSTIC initiative is striving to “make online transactions safer, faster, and more private”

- The Street Identity/LMNOP project is experimenting with authorizing access to verified street addresses

- UMA helps you manage such access and share with others besides just “apps with you sitting behind them”
  - Possibly requiring the requesting party to promise to adhere to your contractual requirements: NDAs, embargoes, payment...

- For true online safety, contracts must be enforceable (see the UMA Trust Model – and stay tuned for more to come)
Use case: Protecting hData electronic health records (EHRs)

• EHR technologies are at the heart of health care debates in many countries

• Project hData.org is a new approach in answer to these debates
Use case: Protecting hData electronic health records (EHRs)

• The hData specification requires the ability for patients to protect their health records based on their authorization

• UMA allows patients to share their EHRs based on their authorization
Use case: Protecting hData electronic health records (EHRs)

- A dual challenge: high security plus dynamic introduction of parties
- This challenge can be solved with the help of OpenID Connect's Dynamic Discovery method
Introduction: What is UMA, why do we need it, and how far along is it?

Use cases illustrating UMA’s unique strengths

**Why would an organization want to UMA-enable its apps?**

Existing UMA implementations

How UMA works to build technical and business trust

Q&A
Web apps that become UMA hosts can easily offer “context, control, choice, and respect”
Web apps that become UMA hosts can easily offer “context, control, choice, and respect”

• You can provide sophisticated protection and sharing of any user content or data that isn’t meant to be fully public
Web apps that become UMA hosts can easily offer “context, control, choice, and respect”

• You can provide sophisticated protection and sharing of any user content or data that isn’t meant to be fully public

• You can outsource the entire job to third parties (AMs)
Web apps that become UMA hosts can easily offer “context, control, choice, and respect”

- You can provide sophisticated protection and sharing of any user content or data that isn’t meant to be fully public
- You can outsource the entire job to third parties (AMs)
- You can ensure that the protection of sensitive resources is stronger than the “private URL trick”
Web apps that become UMA hosts can easily offer “context, control, choice, and respect”

- You can provide sophisticated protection and sharing of any user content or data that isn’t meant to be fully public
- You can outsource the entire job to third parties (AMs)
- You can ensure that the protection of sensitive resources is stronger than the “private URL trick”
- You can build trust more readily with users who are “privacy fundamentalists”
Web apps that become UMA hosts can easily offer “context, control, choice, and respect”

• You can provide sophisticated protection and sharing of any user content or data that isn’t meant to be fully public
• You can outsource the entire job to third parties (AMs)
• You can ensure that the protection of sensitive resources is stronger than the “private URL trick”
• You can build trust more readily with users who are “privacy fundamentalists”
• You can integrate these features using lightweight OAuth, JSON, HTTP, and REST paradigms and a freely implementable protocol
Identity providers that become UMA AMs can centrally coordinate sharing of anything to anyone.
Identity providers that become UMA AMs can centrally coordinate sharing of anything to anyone

- The separation between IdPs and other attribute providers has long been acknowledged – you can never be the sole trusted source of all interesting user data
Identity providers that become UMA AMs can centrally coordinate sharing of anything to anyone

- The separation between IdPs and other attribute providers has long been acknowledged – you can never be the sole trusted source of all interesting user data

- OpenID Connect is solving how you as an IdP can act as a discovery hub for OAuth-mediated access to attributes
Identity providers that become UMA AMs can centrally coordinate sharing of anything to anyone

• The separation between IdPs and other attribute providers has long been acknowledged – you can never be the sole trusted source of all interesting user data

• OpenID Connect is solving how you as an IdP can act as a discovery hub for OAuth-mediated access to attributes

• UMA complements it by solving how you as an IdP can now act as an authorization hub for access by “others besides Alice” to:
  • Trusted attributes
  • User-generated content
  • APIs
Introduction: What is UMA, why do we need it, and how far along is it?

Use cases illustrating UMA’s unique strengths

Why would an organization want to UMA-enable its apps?

**Existing UMA implementations**

How UMA works to build technical and business trust

Q&A
Major implementation work to date

- The SMART project begun at Newcastle University
- Fraunhofer AISEC photo-sharing project
- Synergetics TAS³/UMA integration
The SMARTAM.org project

UMA Reference Implementation
Use Case: Controlling Photo Sharing

MOTIVATION

Protecting your Privacy

• Empowering Users
• Controlling Web Resources
• Unifying Authorization

Use Case: Controlling Photo Sharing

• User can easily share photos from their mobile devices with family, friends, and world.
• Upload to UMA-enabled photo sharing services (e.g. Cloud services), also accessible from their mobile devices
• With simple policies whom to share (me, participants, and world)
• Requester should authenticate in order to access any photos
• Showed at Fraunhofer AISEC Opening Event (Sep 2011) and WWRF Conference, Düsseldorf (Oct 2011)
Setting the scene

1. Mario takes a photo of Eve at a conference.
2. Eve agrees on uploading the photo to AISEC’s photo gallery service.
3. Before uploading Eve chooses the sticky policy determining who might get access to the photo. Here, default policies are:
   a) Only the user her-/himself
   b) Participants of the conference
   c) Internet – free download
4. According to the policy (a) the photo will be uploaded restricted to Eve’s eyes only.
5. Mario’s boss checks the gallery for available photos but he cannot see Eve’s photo.

FAQ Research & Development

• Which parts of the UMA protocol have been implemented?
  Introduction & registration of host and AM, scope and resource registration, policy administration, third-party login at AM and HOST.

• What are the key technologies used?
  Java, JSP, Spring 3.0, Apache Tomcat, iBatis, PostgreSQL, Navicat, Dreamweaver, Restfull, JSON

• What have been the key challenges implementing UMA?
  Scope registration acted according to the policy at AM.

• What is the current status of the Open Source approach?
  Should be open source, but where to publish not yet clear.

• What are the next steps regarding our reference implementation?
  – Extending resource management including personal information -> kind of I-card.
  – Managing PI and build reputational system -> kind of R-card.
  – AM - Personal data backup and synchronization in a Cloud (AM as a Service)
  – AM-lite for mobile devices (Android, iPhone -> Web-based vs App)
  – Integration of OpenID-Connect
  – PayPal Access (Identity and attribute provider product) Integration
Synergetics project: TAS³ is getting an UMA connector

*Trusted Architecture for Securely Shared Services*

The TAS³ project is working to produce an architecture in which data can be shared and reused securely and safely within a trusted environment. Most importantly, it puts users in control of what happens to their data and allows them to see when and by whom it has been accessed. For more information visit www.tas3.eu or www.zxid.org.

Synergetics is now developing the UMA connector to its end-to-end trust assurance framework, which otherwise focuses primarily on machine-to-machine and deep web service calls.
Introduction: What is UMA, why do we need it, and how far along is it?

Use cases illustrating UMA’s unique strengths

Why would an organization want to UMA-enable its apps?

Existing UMA implementations

How UMA works to build technical and business trust

Q&A
Here is UMA’s history with OAuth

ProtectServe

1.0

1.0

... 2.0

we're right about here
The UMA players can be seen as enhanced OAuth players.

- **Think “resource owner”**
- **Think “resource server”**
- **Think “authz server”**
- **Think “client”**

Could be identical to resource owner or not.
The UMA players can be seen as enhanced OAuth players

Technical trust begins with UMA defining a formal protected interface between the host and AM – using OAuth

could be identical to resource owner or not

think “resource owner”

think “resource server”

think “authz server”

think “client”
By contrast, here is UMA’s history with OpenID

we’re right about here

OpenID Connect

ProtectServe

UMA

UMA

...
Business trust has many moving parts; claims-based authorization is one key
UMA has three phases

1. Protect a resource
2. Get authorization
3. Access a resource
UMA has three phases

1. Protect a resource
2. Get authorization
3. Access a resource
UMA has three phases

1. Protect a resource

2. Get authorization

3. Access a resource

Phases 2 and 3
